M1 - Team Charter

MindPay - Team 13. Socrates and Skeletons

Introduction to Software Engineering (15031001) | Reference: MindPay SRS

GitHub: github.com/2550expo-tech/MIndPay · Revised 9 November 2026 to match this repository.

Project Information	Details
Project Name	MindPay - Personal Finance Management and Spending Insight Assistant
Team Name + Members (ID, Name)	13. Socrates and Skeletons 6931503089 Aoengthai Saesae 6931503077 Sithikan Potiyun 6931503072 Witchayapong Lamchaona 6931503069 Vorachon Srijariyakorn 6931503055 Patcharapornchai Khapai

1. Problem

Topic	Content
What is the problem? (2-3 sentences)	Smartphone users who regularly make and receive payments through mobile banking often postpone recording expenses because they have to re-enter information and search for slips manually. This leads to incomplete data and unreliable financial summaries. Users therefore see only their balance, without visibility into their spending rate or the date when their funds may become low, making it difficult to adjust their behavior in time.
Who experiences this problem?	Smartphone users who use mobile banking several times per week, have a monthly budget, and do not consistently record their expenses.
Why is it important / What is lost?	Time is lost to repeated data entry, financial data remains incomplete, decisions are based only on the current balance, and there is a risk of overspending before the end of the month.

2. Gate 1 - Real Users (at least 3 users before Week 4)

#	Name / Role	Contact Method	When
1	Phuphathai Jantharapraphaphon	DM.IG: phuphathai	9/4/2026 12:00 Dormitory Lamduan 2
2	Pitpasin rattanasrinurangkul	DM.IG: pitpasinrattanna	9/4/2026 12:00 Dormitory Lamduan 2
3	Prachaya Suma	DM.IG: _zfop.xz1	9/4/2026 12:00 Dormitory Instagram

3. Gate 2 - MVP Shape

FR	
FR-1	Transaction Management - Add, edit, categorize, and delete the user's own transactions
FR-2	Overview Dashboard - Display income, expenses, balance, and totals by category
FR-3	Voice Transaction Logging - Convert the user's spoken transaction into an editable draft that can be corrected and confirmed before saving
FR-4	Automatic Gallery Slip Detection - Detect payment slips in the gallery when the app opens or when the user taps Scan Slips, using an 80% confidence threshold and duplicate checks
FR-5	AI Coach "Nong Kla" - Explain confirmed information through the app's mascot, Nong Kla, in one calm and friendly voice, as text and speech
FR-6	Money Runway - Estimate the date when the balance may become low based on the 7-day average expense

Which FR carries a real rule or decision?

FR-4 and FR-6. FR-4 uses an 80% confidence threshold and checks for duplicate transactions. FR-6 calculates the estimated low-balance date from the 7-day average daily expense and handles the zero-expense case.

What data has to persist between sessions?

User account, confirmed transactions, categories, budget settings, and savings goals. Voice results and unclear slip readings remain drafts until confirmed by the user.

4. Gate 3 - Access

Data / Licence / System	Dependencies	How access will be verified
Test Data	Simulated transaction records and slips from consenting users	Have sample datasets and consent records; do not use unauthorized data.
Devices	Phone permissions Microphone and Photo Library	Test permissions and read sample data on the team's devices.
Speech / OCR / AI	Services or libraries permitted by their licences	Review licence/free-tier documentation and keep successful sample-request results before starting the increment.

5. Process and Team

Selected SDLC	One-line Rationale
Planning	Clearly define the scope, backlog, priorities, and timeline before development begins so the team can divide tasks and track MindPay's progress within 4 months.
